

## Chapter 5 – Elasticity and Its Applications

Do they depend both on the numbers of hours worked?

- What is elasticity? What kinds of factors can increase, decrease, or stabilize it?
- What is the price elasticity of demand? How is it related to the demand curve? How is it related to demand's steepness?
- What is the price elasticity of supply? How is it related to the supply curve?
- What are the income and cross-price elasticities of demand?

Do they?

Do they depend both on the numbers of hours worked?

Do they depend on the price of leisure and leisure's utility relative to work?

Do they depend on being able to distinguish the opportunity cost of your leisure, as you're thinking of giving your time to leisure?

Do they depend on the fact that you are not just an income maximizer, if you have your own time that you have to spend? How much will your personal time or budget constraint increase?

Answers:

- Some price elasticity measures how much the variable responds to changes in another variable.
  - One type of elasticity measures how much demand for one variable will fall if another variable rises.
- Another elasticity is a formal measure of the responsiveness of  $Q^D$  to  $P$  or  $Q^S$  to one of its determinants.

Price Elasticity of Demand

- Price elasticity of demand measures how much  $Q^D$  responds to a change in  $P$ .
- It measures the price sensitivity of buyers' demand.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Along a demand curve,  $P$  and  $Q$  move in opposite directions, which usually makes price elasticity negative. We will look at this sign, and learn different methods to compute it.

Example:

The price elasticity of demand for apples is  $-0.75$  when the price of apples is  $\$1.00$  and the quantity demanded is 100.

Calculating Percentage Change

Price falls from  $\$1.00$  to  $\$0.75$ , a change of  $-(100)(.25)$ .

Quantity falls

from 100 to 75, a change of  $-(100)(.25)$ .
