Fundamental Electron Interactions with Plasma Processing Gases Loucas G. Christophorou, James K. Olthoff, 2012-12-06

This volume deals with the basic knowledge and understanding of fundamental interactions of low energy electrons with molecules. It provides an up to date and comprehensive account of the fundamental interactions of low energy electrons with molecules of current interest in modern technology especially the semiconductor industry. The primary electron molecule interaction processes of elastic and inelastic electron scattering, electron impact ionization, electron impact dissociation and electron attachment are discussed and state of the art authoritative data on the cross sections of these processes as well as on rate and transport coefficients are provided. This fundamental knowledge has been obtained by us over the last eight years through a critical review and comprehensive assessment of all available data on low energy electron collisions with plasma processing gases which we conducted at the National Institute of Standards and Technology NIST. Data from this work were originally published in the Journal of Physical and Chemical Reference Data and have been updated and expanded here. The fundamental electron molecule interaction processes are discussed in Chapter 1. The cross sections and rate coefficients most often used to describe these interactions are defined in Chapter 2 where some recent advances in the methods employed for their measurement or calculation are outlined. The methodology we adopted for the critical evaluation, synthesis and assessment of the existing data is described in Chapter 3. The critically assessed data and recommended or suggested cross sections and rate and transport coefficients for ten plasma etching gases are presented and discussed in Chapters 4, 5 and 6.

Gaseous Electronics Gorur Govinda Raju, 2018-09-03. With the constant emergence of new research and application possibilities, gaseous electronics is more important than ever in disciplines including engineering, electrical power, mechanical electronics and environmental physics and electronics. The first resource of its kind, Gaseous Electronics: Tables, Atoms and Molecules, fulfills the author's vision of a stand alone reference to condense 100 years of research on electron neutral collision data into one easily searchable volume. It presents most if not all of the properly classified experimental results that scientists, researchers and students require for a theoretical and practical understanding of collision properties and their impact. An unprecedented collection and analysis of electron neutral collision properties. This book follows a new user friendly format that enables readers to easily retrieve, analyze and apply specific atomic molecular information as needed. In his previous work Gaseous Electronics: Theory and Practice the author first explored electron neutral interactions. To clarify the complex fundamental processes involved he cited as much experimental data on atoms and molecules as limited space would allow. Completing that task, this handy reference more fully compiles essential revised data on more than 420 atoms and molecules, arranging it into easily digestible chapters, sections and appendices. Analysis parameters include total scattering, ionization, excitation, attachment, cross sections, ionization and attachment coefficients, attachment rates and ion drift velocity. Some recent research areas in gaseous electronics include Environmentally efficient

and protective lighting devices Plasma research for power generation and space applications Medical applications some involving skin treatment and healing Written entirely in SI units the book includes hundreds of tables figures and specially drawn charts with data expressed in both tabular and graphical form Each chapter stands independently and contains references for further research

The Physics of Ionized Gases Ljupco Hadzievski,Tasko Grozdanov,Natasa Bibic,2004-12-14 The very nature of the Symposium on the Physics of Ionized Gases SPIG is to have four different fields that converge into one multidisciplinary field of the physics of ionized gases gas phase and binary collisions collisions with surfaces low temperature plasmas and collective phenomena These four fields have strong interactions in numerous applications However due to the development of specialized international conferences it has become increasingly rare that such a wide range of topics is covered at a single conference As the four fields often overlap and merge in numerous fundamental studies and more importantly applications SPIG serves as a venue for exchanging ideas in the four related fields This volume contains the invited lectures topical invited lectures and progress reports presented at the 22nd Summer School and International Symposium on the Physics of Ionized Gases SPIG 2004 The papers were peer reviewed by the scientific committee
