

Chapter 5 – Elasticity and Its Applications

Do they depend both on the numbers of hours worked?

- What is elasticity? What kinds of numbers can elasticity take? Is it unitless?
- What is the price elasticity of demand? How is it related to the demand curve? How is it related to demand's steepness?
- What is the price elasticity of supply? How is it related to the supply curve?
- What are the income and cross-price elasticities of demand?

Key concepts:

Two things matter to most economists:

the change in price and quantity and the response of those

two things when facing uncertainty. The opportunity cost of your time, the value of having off-time, your goal to save.

How can I measure how much you want to do today? How much do you want your good? How many hours worked? How much will you demand for an hour of your labor?

Example:

- Some good. Quantity measured how much and various opportunity changes in other variables.
 - One type of elasticity measures how much demand for other variables will fall if one falls.
- Definition:
 - Measuring is a numerical measure of the responsiveness of Q^D or Q^S to a change in its determinants.

Price Elasticity of Demand

- Price elasticity of demand measures how much Q^D responds to a change in P .
- It measures the price sensitivity of buyers' demand.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Along a demand curve, P and Q move in opposite directions, which usually makes price elasticity negative. We will drop the minus sign and report absolute values for positive numbers.

Example:

The price elasticity of demand is 0.50. If the price of a good falls by 10%,

Calculating Percentage Change

Example: P falls from \$100 to \$90, which is (10/100) = 10%

Example 2:

if P falls from \$100 to \$90, which is (10/100) = 10%
