Gene Pool:

Broadening the Genetic Base of Grain Legumes Mohar Singh, Ishwari Singh Bisht, Manoranjan Dutta, 2014-10-28 Grain legumes play significant and diverse role in the farming systems and provide nutrition security to the largely vegetarian and relatively poorer people around the world. These are ideal crops for achieving three simultaneous developmental goals viz reducing poverty, improving human health and nutrition, and enhancing ecosystem resilience. Globally, grain legumes are the second most important crop group next only to cereals, but a large proportion of area of it is under rainfed low input systems as compared to cereals, contributing to lower yields. The other important factor responsible for reduced yield in grain legumes is the narrow genetic base of the present day pulse varieties. In order to break the yield barriers of these cultivars, new sources of genes/alleles need to be identified and suitably incorporated into the adapted background. The information on various aspects of grain legume improvement, although has been considerable in the recent past, these information are highly scattered and not available at one place. The present book consists of comprehensive and latest crop wise information on important grain legumes of the world including their distribution, gene pool systematics, status of genetic and genomic resources, production constraints, traits of importance, crop improvement methodologies, both conventional as well as contemporary and future strategies to be adopted for comprehensive grain legume improvement in various agro-ecological target areas of the globe. The chapters have been contributed by eminent crop experts from across the world engaged in research in their respective crops for the past several years, thus providing a rare insight into the crop specific constraints and prospects, drawing from their rich overall experience. The book therefore will be a useful source of information to the grain legume researchers, students, policy planners, and developmental experts alike.

Chickpea: Crop Wild Relatives for Enhancing Genetic Gains Mohar Singh, 2020-02-29 Chickpea Crop Wild Relatives for Enhancing Genetic Gains explores aspects related to critical analysis on factors responsible for narrow genetic base of chickpea productions including domestication bottleneck, the level of diversity present in different cultivated and wild species, the uniqueness and usefulness of potential gene sources available and maintained in production systems across the globe, the level of genetic erosion both at landrace and species level over time and space etc. Despite considerable international investment in conventional breeding, production of chickpea has not yet been significantly improved beyond that achieved through its normal single domestication event and high self-pollination rate. Total annual pulse production of 12 million tons (FAO 2016) is far below actual potential. Susceptibility to both biotic and abiotic stresses have created a production level bottleneck whose solution possibly lies in the use of crop wild relatives and other genetic traits cultivated by tailoring novel germplasm. Presenting options for widening the genetic base of chickpea cultivars by introgression of diverse genes available in distantly related wild Cicer taxa, thus expanding the genetic base and maximize genetic gains from the selection, it is necessary to accumulate other complimentary alleles from CWRs. This review will focus on present status of gene pool and species distribution, germplasm conservation.

characterization and evaluation problems associated with crop production sources of target traits available in wild species status of trait introgression in synthesizing new gene pool of chickpea along with progress made in chickpea genomics An edited book with contributions from leading scientists this information will guide and inform chickpea breeders PGR researchers and crop biologists across the world Presents both conventional and emerging techniques Provides insights into gene pyramiding as cytogenic manipulations Includes case studies highlighting the impact of improving chickpea production

Broadening the Genetic Base of Grain Cereals Mohar Singh, Sandeep Kumar, 2016-09-13 This book offers comprehensive coverage of important grain cereals including their origin and distribution crop gene pool level of diversity production constraints traits of importance for genetic base widening crop improvement methodologies genome mapping genomics for breeding and future strategies The chapters contributed by eminent crop researchers from around the world provide rare insights into the crop specific constraints and prospects drawing from their substantial experience As such the book offers an essential source of information for grain cereals scientists teachers students policy planners and developmental experts alike Grain cereals which comprise rice wheat maize barley oats sorghum and millets are members of the grass family These crops are vital to human nutrition thanks to their roles as staple food crops in different parts of the globe Some of them are rich sources of carbohydrates which provide energy while others are important sources of minerals vitamins and proteins in addition to their medicinal properties In most cereals the existing variability among elite germplasm has been exploited to attain a desirable level of productivity However to make further breakthroughs in enhancing yield and improving stability in future crop cultivars new sources of genes alleles need to be identified in wild weedy species and incorporated into the cultivated varieties Though there have been many publications on various aspects of grain cereal improvement in the recent past to date this essential information has remained scattered among different periodicals

Vegetable Crops Pritam Kalia, 2025-04-24 The volume on Vegetable Crops as a part of series entitled Handbooks of Crop Diversity Conservation and Use of Genetic Resources will be a unique resource first of its kind which will elaborate on origin evolution taxonomy identification chemical characterization and genetic improvement of Vegetable Crop Plants Vegetable crops are an important group of crops comprising solanaceous vegetables Cole crops Cucurbitaceous crops Bulb crops Root crops Tuber crops legume vegetables leafy salad vegetables Okra etc There is tremendous diversity within each group of vegetable crops This genetic diversity is from the point of view of landraces and varieties of vegetable crops species used for food processing nutraceuticals pharmaceuticals etc Vegetables being an integral part of human diet being rich source of diverse nutrients such as vitamins minerals and antioxidants they play an important role in balancing the diet and tackling malnutrition Besides due to their intensive cultivation they also play an important role in enhancing per unit area production and productivity cropping intensity enhancing thereby the farmers income especially that of small and marginal farmers and providing job opportunities The genetic improvement of vegetable crops facilitate continued breeding of varieties with

greater resilience to stresses and productivity is mainly dependent on overall genetic variation found in individuals belonging to the cultivated species and or ancestral species related to cultivated species of vegetable crops Since genes of interest can be tapped from plant sources for their introduction through controlled breeding processes for genetic improvement and incorporating of desirable external and internal quality traits therefore accessibility to the information about these plant genetic resources is key to the success of the breeding efforts Since there is a need of comprehensive information about the genetic resources therefore it is important to facilitate their conservation and long term sustainable use in research and improvement The comprehensive information on the availability of genetic diversity in each vegetable crop species in this volume would facilitate priority conservation in gene banks research and use in vegetable crop improvement Realizing the importance of genetic variability in the improvement of vegetable crops from the point of view of biotic and abiotic stress resistance enhanced micronutrient climate change enhanced shelf life nutraceuticals bioactive compounds especially national and international efforts further need to be stepped up for collection characterization evaluation and conservation of vegetable crops genetic resources to facilitate search for new genes research and their use in vegetable crops improvement During 21st century genomics and marker assisted tools have gained importance for hastening the crop improvement programmes by enhancing breeding efficiency Realizing that population in South Asia and Southeast Asia is facing acute problem of under and malnutrition the emphasis on dietary diversification with vegetables is therefore being stressed Besides to enhance farmers income much emphasis is being laid on development of varieties having diverse maturity growth habit resistance to diseases and insect pest to reduce the use pesticides enhanced nutrients and shelf life For these traits we have to look into landraces and wild relatives for the traits of interest Therefore it has been felt to bring out a vegetable volume with additional accessory and supplemental information analyses and specifically filtered information which can go a long way in promoting research search for new genes alleles revealing the opportunities available for exploitation of PGR in generation of cultivars to meet upcoming challenges of vegetable crop improvement and diversification and requirement of cultivars for processing nutraceutical and pharmaceutical industry which will promote contract farming This will also help identification of geographical and genetic diversity gaps for future search of new genes collections Plant Genetic Resources PGR serve as treasures of genes of interest for developing improved future vegetable varieties hybrids besides being key to scientific efforts of developing gene pyramided varieties they are important for mitigating various challenges posed by increasing population climate change and health conscious society looking for nutraceuticals The proposed vegetable volume on agro biodiversity conservation and use of plant genetic resources with information on available genetic diversity among various groups of vegetable crops and component cultivated species with in a group of food and agriculture in all possible perspectives would be able to reflect the opportunity available for genetic engineering of vegetable crop species It will also go a long way in facilitating more predictive and productive genetic engineering programme to breed futuristic vegetable
