explains in detail the morphology of folded layers and the mechanism involved in folding He goes on to interpret the formation of outcrop patterns as well as the structure of a cylindrical and cylindroidal fold patterns The author also describes the different structures that result from the brittle fractures present in rocks that undergo massive stress Of interest is the presentation of how fissures and mineral veins are formed and deposited The author then discusses earth movements resulting in angular unconformities known as stratigraphic break These breaks in the stratigraphic record such as diastems non sequences paraconformities or disconformities can be interpreted as the intervals of geological time The book then explains the nature of tectonic maps which involves features arising from the continental crust and how these maps are different from geological maps that show the outcrop of lithostratigraphic units Geologists cartographers meteorologists seismologists land use developers and students of the earth sciences will find this book valuable **Geological Maps**
