Reddi,1996 Due to liability issues landfills are no longer considered the best method of waste disposal Innovative safe disposal methods for large quantities of contaminated soils and waste are sought by engineers In urban or

industrial areas with most of the contamination it has become very attractive to engineer contaminated soils and waste by physical or chemical methods and reuse them as construction materials This proceedings addresses the following the creation of useful products from contaminated soils and waste changes in soil or waste properties after processing logistics of the operations and the regulatory issues associated with such usage While alternative methods of disposal are being utilized civil engineers are still involved in the development of large containment systems and must continue to increase their knowledge of these systems Solid waste landfills are made of multi layered soil and geosynthetic liner systems underlying the fills and providing surface coverage to a large degree by the shear strengths developed at interfaces between the soils and the geosynthetics forming part of either the liner or the cover systems In this proceedings recent research efforts to measure the interface strength between geomembranes and soils are presented
