Abstract

Too often as a design professionals and educators have seen excellent conceptual ideas suffer during the process of realization, in large part because the designer and engineers did not understand the visual principles of divine proportion and composition. One of the most important things in virtuous looking products is the harmonious proportions of the design and product architecture. As Leonardo Da Vinci did with the human body, and his Vitruvian Man, a great number of studious men have done the same thing with the right proportions of the products. Talking about product design and its characteristics, the harmony of lines and volumes must pass unnoticed. One of the good visual design elements is proportion thus the reference for proportion study is by using golden ratio invented by Fibonacci which naturally the formula has been found in most perceived beautiful nature creations. When talking about the proportion of Aesthetics, golden proportion must be the key theory people may come up with. It first used in the early of the 20th century by Mark Barr with the Greek letter ϕ (pronounce "phi") to present the ratio. This golden ratio is also generally called the "golden proportion", "divine proportion", "golden mean" and so on. The equation can be expressed as $1.618 = \text{height} / \text{width} = \phi$. The aim of this study is to apply the phi matrix to assess the Virtuous Proportion of Aesthetics in Car Dashboard Design in order to assist which of design proposed meet the intended criteria of good design. This study is important as it will contribute to the body of knowledge in design methodology in search for product communicative language in form giving during designing process. It will also revive the approach of golden section in design area.

Analysis and Geometry in Control Theory and its Applications Piernicola Bettiol, Piermarco Cannarsa, Giovanni Colombo, Monica Motta, Franco Rampazzo, 2015-09-01 Since the 1950s control theory has established itself as a major mathematical discipline particularly suitable for application in a number of research fields including advanced engineering design economics and the medical sciences However since its emergence there has been a need to rethink and extend fields such as calculus of variations differential geometry and nonsmooth analysis which are closely tied to research on applications Today control theory is a rich source of basic abstract problems arising from applications and provides an important frame of reference for investigating purely mathematical issues In many fields of mathematics the huge and growing scope of activity has been accompanied by fragmentation into a multitude of narrow specialties However outstanding advances are often the result of the quest for unifying themes and a synthesis of different approaches Control theory and its applications are no exception Here the interaction between analysis and geometry has played a crucial role in the evolution of the field This book collects some recent results highlighting geometrical and analytical aspects and the possible connections between them Applications provide the background in the classical spirit of mutual interplay between abstract theory and problem solving practice
