Geometric Evolution Equations Proc:

Geometric Evolution Equations Shu-Cheng Chang, 2005 The Workshop on Geometric Evolution Equations was a gathering of experts that produced this comprehensive collection of articles Many of the papers relate to the Ricci flow and Hamilton's program for understanding the geometry and topology of 3 manifolds The use of evolution equations in geometry can lead to remarkable results Of particular interest is the potential solution of Thurston's Geometrization Conjecture and the Poincaré Conjecture Yet applying the method poses serious technical problems Contributors to this volume explain some of these issues and demonstrate a noteworthy deftness in the handling of technical areas Various topics in geometric evolution equations and related fields are presented Among other topics covered are minimal surface equations mean curvature flow harmonic map flow Calabi flow Ricci flow including a numerical study Kahler Ricci flow function theory on Kahler manifolds flows of plane curves convexity estimates and the Christoffel Minkowski problem The material is suitable for graduate students and researchers interested in geometric analysis and connections to topology Related titles of interest include *The Ricci Flow An Introduction* Geometric Curve Evolution and Image Processing Frédéric Cao, 2003-02-27 In image processing motions by curvature provide an efficient way to smooth curves representing the boundaries of objects In such a motion each point of the curve moves at any instant with a normal velocity equal to a function of the curvature at this point This book is a rigorous and self contained exposition of the techniques of motion by curvature The approach is axiomatic and formulated in terms of geometric invariance with respect to the position of the observer This is translated into mathematical terms and the author develops the approach of Olver Sapiro and Tannenbaum which classifies all curve evolution equations He then draws a complete parallel with another axiomatic approach using level set methods this leads to generalized curvature motions Finally novel and very accurate numerical schemes are proposed allowing one to compute the solution of highly degenerate evolution equations in a completely invariant way The convergence of this scheme is also proved

Geometric Wave Equations Jalal M. Ihsan Shatah, Michael Struwe, 2000 This volume contains notes of the lectures given at the Courant Institute and a DMV Seminar at Oberwolfach The focus is on the work of the authors on semilinear wave equations with critical Sobolev exponents and on wave maps in two space dimensions Background material and references have been added to make the notes self contained The book is suitable for use in a graduate level course on the topic Titles in this series are co published with the Courant Institute of Mathematical Sciences at New York University *Differential Geometry, Valencia 2001 - Procs Of The Intl Conf Held To Honour The 60th Birthday Of A M Naveira* Olga Gil-medrano, Vicente Miquel, 2002-07-18 This volume presents the proceedings of a conference on differential geometry held in honour of the 60th birthday of A M Naveira The meeting brought together distinguished researchers from a variety of areas in Riemannian geometry The topics include geometry of the curvature tensor variational problems for geometric functionals such as Willmore Chen tension volume and energy of foliations and vector fields and energy of maps Many papers

concern special submanifolds in Riemannian and Lorentzian manifolds such as those with constant mean scalar Gauss etc curvature and those with finite total curvature

Surface Evolution Equations Yoshikazu Giga, 2006-03-30 This book presents a self contained introduction to the analytic foundation of a level set approach for various surface evolution equations including curvature flow equations These equations are important in many applications such as material sciences image processing and differential geometry The goal is to introduce a generalized notion of solutions allowing singularities and to solve the initial value problem globally in time in a generalized sense Various equivalent definitions of solutions are studied Several new results on equivalence are also presented Moreover structures of level set equations are studied in detail Further a rather complete introduction to the theory of viscosity solutions is contained which is a key tool for the level set approach Although most of the results in this book are more or less known they are scattered in several references sometimes without proofs This book presents these results in a synthetic way with full proofs The intended audience are graduate students and researchers in various disciplines who would like to know the applicability and detail of the theory as well as its flavour No familiarity with differential geometry or the theory of viscosity solutions is required Only prerequisites are calculus linear algebra and some basic knowledge about semicontinuous functions

Mathematics for Nonlinear Phenomena – Analysis and Computation Yasunori Maekawa, Shuichi Jimbo, 2017-11-01 This volume covers some of the most seminal research in the areas of mathematical analysis and numerical computation for nonlinear phenomena Collected from the international conference held in honor of Professor Yoshikazu Giga s 60th birthday the featured research papers and survey articles discuss partial differential equations related to fluid mechanics electromagnetism surface diffusion and evolving interfaces Specific focus is placed on topics such as the solvability of the Navier Stokes equations and the regularity stability and symmetry of their solutions analysis of a living fluid stochastic effects and numerics for Maxwell s equations nonlinear heat equations in critical spaces viscosity solutions describing various kinds of interfaces numerics for evolving interfaces and a hyperbolic obstacle problem Also included in this volume are an introduction of Yoshikazu Giga s extensive academic career and a long list of his published work Students and researchers in mathematical analysis and computation will find interest in this volume on theoretical study for nonlinear phenomena

Mathematical Aspects of Evolving Interfaces Luigi Ambrosio, Klaus Deckelnick, Gerhard Dziuk, Masayasu Mimura, Vsvolod Solonnikov, Halil Mete Soner, 2003-01-01 Interfaces are geometrical objects modelling free or moving boundaries and arise in a wide range of phase change problems in physical and biological sciences particularly in material technology and in dynamics of patterns Especially in the end of last century the study of evolving interfaces in a number of applied fields becomes increasingly important so that the possibility of describing their dynamics through suitable mathematical models became one of the most challenging and interdisciplinary problems in applied mathematics The 2000 Madeira school reported on mathematical advances in some theoretical modelling and numerical issues concerned with dynamics of interfaces and free boundaries

Specifically the five courses dealt with an assessment of recent results on the optimal transportation problem the numerical approximation of moving fronts evolving by mean curvature the dynamics of patterns and interfaces in some reaction diffusion systems with chemical biological applications evolutionary free boundary problems of parabolic type or for Navier Stokes equations and a variational approach to evolution problems for the Ginzburg Landau functional Mathematical Aspects of Evolving Interfaces , **The Ubiquitous Heat Kernel** Jay Jorgenson,2006 The aim of this volume is to bring together research ideas from various fields of mathematics which utilize the heat kernel or heat kernel techniques in their research The intention of this collection of papers is to broaden productive communication across mathematical sub disciplines and to provide a vehicle which would allow experts in one field to initiate research with individuals in another field as well as to give non experts a resource which can facilitate expanding their research and connecting with others

coverage ranging from the rhythms of the nervous system to optimal transportation elasto plasticity computational drug design hydrodynamic and meteorological modeling and valuation in financial markets Many papers are direct products of the computer revolution grid generation multi scale modeling high dimensional numerical integration nonlinear optimization accurate floating point computations and advanced iterative methods Other papers demonstrate the close dependence on developments in mathematics itself and the increasing importance of statistics Additional topics relate to the study of properties of fluids and fluid flows or add to our understanding of Partial Differential Equations
