### Essay on Petroleum Economics: Examining Factors to Make Investment Decisions Essay

## Introduction

Economics in petroleum engineering entails the employment of methods of economic assessment at every phase in the growth of oil and gas exploration and production ventures. Through the examination of economic factors, such as the level of information concerning the oil or gas site, market environments, and the influence of tax or royalty, enables petroleum economists to make investment choices (Fanchi & Christiansen, 2017). Other economic factors vital in petroleum engineering includes the location, type, and several wells. Besides, economists in the oil and gas industry deliberate on the net cash flow, payout, and return on investment (Brown, 2016).

Such factors help in making effective decisions on whether or not to start drilling and exploring petroleum wells, or whether or not to develop a whole gas production scheme. Petroleum economists also consider the scrutiny and management of the economic, technical, and other risks related to various stages of petroleum projects (Fanchi & Christiansen, 2017). The purpose of this paper entails the examination of economic factors in the petroleum industry, such as the net cash flow, payout, and return on investment that influences investment decisions.

## Net Cash Flow (NCF) in Petroleum Engineering

The net cash flow in petroleum engineering businesses consists of various modules, some positive while others negative. Net cash flow refers to profit, which entails revenue minus costs. Capital expenditure (CAPEX) refers to the entire investment the company makes in the petroleum project, such as laying pipelines, costs of drilling wells (like tubing, casing, and completion), manifolds, and treatment (Brown, 2016). CAPEX gets paid at the start of the project. However, sometimes CAPEX gets acquired in the course of executing the plan like when effecting secondary rescue approaches that require extra surface competences like water injection reservoirs and pumps, or after the project during plugging and desertion of the site.

CAPEX consist of tangible and intangible costs. The substantial costs refer to any procured touchable or visible physical aspect of the project. Real prices depreciate typically, that is, the value of the product decreases over time. Intangible costs refer to untouchable or unnoticeable components of the project (Brown, 2016). Invisible costs undergo amortization (permits the decrease in the worth of the elusive element over a fixed period). The recovery approach and schedule of the payment get influenced by the inflation rate.

Operating expenditure (OPEX) involves the entire costs linked to the fluid lift from the wells to the surface, distillation, treatment, shipment, and reservoir workover. Secondary operating expenditure recovery has more necessities, hence always higher than that for primary improvement (Fanchi & Christiansen, 2017). Depreciation refers to an accounting technique of assigning the expense of tangible asset over its useful life and defines the decrease in value. Devaluation always appears in
