

FOSSILS

Fossils are the preserved remains of a living thing, such as plants and animals. A fossil is at least 10,000 years old. Some are preserved in great detail, while others only contain traces of a living thing. Fossils are often found in rocks and buried beneath the Earth's surface. The word *fossil* comes from a Latin word meaning "dug up." There are many different types of fossils. Paleontologists, scientists who study fossils, group fossils into two major categories: body or trace.

BODY FOSSILS

Body fossils are the rocky remains of organisms that preserve plant or animal body parts. This type of fossil helps show what an animal or plant looked like. Bones, teeth, and shells are examples of body fossils. They can preserve an entire animal or plant. Only a few bones are usually found during fossil digs. Complete skeletons are

very rare. Fossils may be jumbled together in larger finds. Separating them can be a difficult job. It is like working on a puzzle with both missing and extra pieces. A dinosaur named Sue is the largest and most complete *Tyrannosaurus rex* ever discovered.

TRACE FOSSILS

Fossils are not just the remains of dead organisms. Trace fossils record the activity of ancient plants and animals. They show how an animal lived. Footprints, animal tracks, tooth marks, and burrows are examples of trace fossils. Eggshells and nests are also trace fossils. Trace fossils are sometimes all that remain of soft-bodied animals.

DATING FOSSILS

Determining the age of a fossil can be tricky. Paleontologists use several methods. One is radiometric dating tests. These tests estimate the age of rocks near the fossil. Relative dating, such as stratigraphy, can be used too. Rocks are formed in layers, known as strata. The oldest layers are on the bottom, while the most recent layers are near the top. A fossil in the bottom layer is likely older than a fossil in a top layer. Index fossils can also help reveal a fossil's age. They are from organisms that only lived a short time. Scientists know when the organisms lived, so they can use their fossils to date other fossils. Some fossils are found in the same layer of rock as an index fossil, so they are likely close in age.

FORMATION

Few plants and animals become fossils. They usually decay or are eaten by animals. Remains must be buried to become fossils, so they do not break down. Fossils are plant and animal remains that have been naturally preserved. There are several ways that a fossil may form.
