Rajasekhar,2009-03-04 Stem cells appear to be fundamental cellular units associated with the origin of multicellular organisms and have evolved to function in safeguarding the cellular homeostasis in organ t sues The characteristics of stem cells that distinguish them from other cells have been the fascinating subjects of stem cell research The important properties of stem cells such as ma tenance of quiescence self renewal capacity and differentiation potential have propelled this exciting eld and presently form a common theme of research in developmental biology and medicine The derivation of pluripotent embryonic stem cells the prospective identi cation of multipotent adult stem cells and more recently the induced pluripotent stem cells popularly called iPS are important milestones in the arena of stem cell biology Complex networks of transcription factors different signaling molecules and the interaction of genetic and epi netic events constantly modulate stem cell

behavior to evoke programming and reprogramming processes in normal tissue homeostasis during development. In any given cellular scenario, the regulatory networks can pose considerable complexity and yet exert an orderly control of stem cell differentiation during normal development. An aberration in these newly tuned processes during development usually results in a spectrum of diseases such as cancers and neurological disorders.

This underscores the imminent need for a more complete understanding of molecular mechanisms underlying the regulatory circuitries required for stem cell maintenance. Over the past 35 years,

a diverse group of bench and physician scientists have prospectively enhanced our knowledge of stem cell biology. These studies are unveiling many unrecognized or previously unknown fundamentals of developmental biology. **Harrison's Principles**

of Internal Medicine Anthony S. Fauci, 2008. Harrison's has defined internal medicine for millions of physicians and students worldwide since 1950. This Seventeenth Edition retains its balance of science and patient management and has been massively updated to include an innovative array of new features and content. Beyond the expansion of an illustration program with more than 300 new additional illustrations, the acclaimed Approach to the Patient and Treatment features have been redesigned to make referencing the content faster than ever before. Readers will find an expanded focus on global health including a Global Advisory Board composed of 11 prominent medical experts from around the world and a chapter on Global Considerations in Medicine by Jim Kim and Paul Farmer. Also, the new chapter on the Epidemiology of Cardiovascular Diseases provides a uniquely valuable summary of this emerging global epidemic. A new Global Considerations icon identifies epidemiologic, diagnostic, and therapeutic distinctions between **Stem Cell Research** Janet T. Arnes, 2006.

Embryonic stem cells have the ability to develop into virtually any cell in the body and may have the potential to treat medical conditions such as diabetes and Parkinson's disease. In August 2001, President Bush announced that for the first time federal funds would be used to support research on human embryonic stem cells, but funding would be limited to existing stem cell lines. The National Institutes of Health (NIH) has established the Human Embryonic Stem Cell Registry, which lists stem cell lines that are eligible for use in federally funded research. Although 78 cell lines are listed, 21 embryonic stem cell lines are currently available. Scientists are concerned about the quality, longevity, and availability of the eligible stem cell lines. For a variety of reasons, many believe research advancement requires new embryonic stem cell lines, and for certain applications, stem cells derived from cloned embryos may offer the best hope for progress in understanding and treating disease. A significant cohort of pro-life advocates support stem cell research; those opposed are concerned that the isolation of stem cells requires the destruction of embryos. Letters from Congress, one signed by 206 Members of the House and a second signed by 58 Senators, have been sent urging President Bush to expand the current federal policy concerning embryonic stem cell research. Some have argued that stem cell research be limited to adult stem cells obtained from tissues such as bone marrow. They argue that adult stem cells should be pursued instead of embryonic stem cells because they believe the derivation of stem cells

from either embryos or aborted fetuses is ethically unacceptable Other scientists believe adult stem cells should not be the sole target of research because of important scientific and technical limitations Groups make ethical distinctions in the debate on how to proceed with stem cell research based upon embryo protection relief of suffering viability the purpose and timing of embryo creation and destruction donor consent scientific alternatives federal funding and cloning Other countries are moving fast with active research programs This book presents the current confused situation along with a selective bibliography
