

How the Box Works

The Personal Genome Machine looks like a piece of consumer electronics, and it uses the same core technology (a silicon chip that can measure electrical charge), along with the fact that DNA letters (A, T, C and G), or bases, bind in specific pairings.

How does this sequence DNA? One base at a time. A charged ion is released only if, as in this case, the DNA letters in solution match up to the one that needs to be sequenced next, as you can see above.

If the DNA letter doesn't match up, no base is combined and no charge is released, and the machine knows to try one of the other options—in this case, to move on from Gs to Ts, Cs and As.

If there are several identical DNA letters in a row, more ions are released and the machine can measure this extra spike in charge.
