

Generalized Multivariate Analysis of Variance

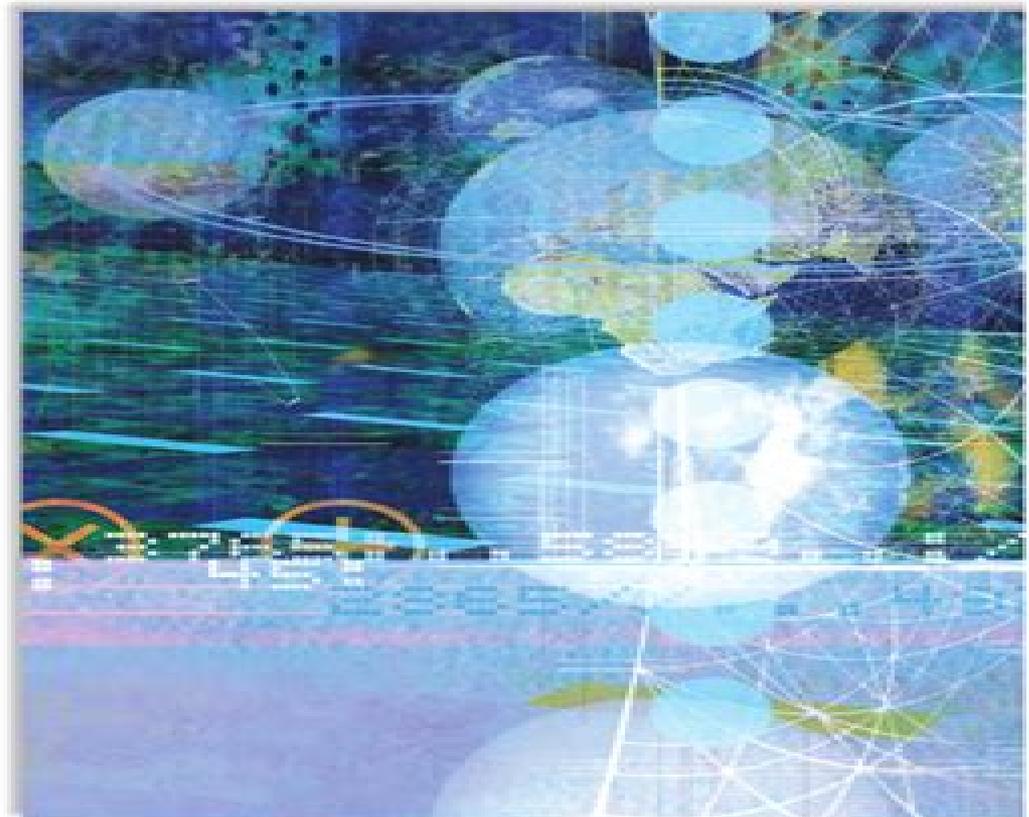

A unified framework for signal processing in correlated noise

Aleksandar Dogandžić and Arye Neborai

Generalized multivariate analysis of variance (GMANOVA) [1]-[19] and related reduced-rank regression [10]-[15] are general statistical models that comprise versions of regression, canonical correlation, and profile analyses as well as analysis of variance (ANOVA) and covariance in univariate and multivariate settings. It is a powerful and, yet, not very well-known tool. In this article, we develop a unified framework for explaining, analyzing, and extending signal processing methods based on GMANOVA. We show the applicability of this framework to a number of detection and estimation problems in signal processing and communications and provide new and simple ways to derive numerous existing algorithms for

- ▲ synchronization and space-time channel and noise estimation in [16]-[33]
- ▲ space-time symbol detection in [23] and [30]-[38]
- ▲ blind and semiblind channel equalization, estimation, and signal separation in [39]-[44]
- ▲ source location using parametric signal models in [17], [23], [28], [31], and [45]-[51]
- ▲ radar target estimation and detection in [45]-[50] and [52]-[55]
- ▲ spectral analysis [56], [57] and nuclear magnetic resonance (NMR) spectroscopy [58].

Many of the above methods were originally derived "from scratch," without knowledge of their close relationship with the GMANOVA models. We explicitly show this relationship and present new insights and guidelines for generalizing these methods. We also acknowledge the pioneering works of Brillinger (on frequency wavenumber analysis; see [59]) and Kelly and Forsythe (on radar detection; see [53]) who

The theory of generalized multivariate analysis based on elliptically contoured distributions represents a brilliant achievement in the field of multivariate analysis This is the first book on the subject The text discusses estimation of parameters testing of hypotheses and linear models employing the method of stochastic representation rather than following the classical treatments It is designed as a textbook for a one semester course at postgraduate level and as a reference source for lecturers and researchers

Multivariate Statistical Modelling Based on Generalized Linear Models Ludwig Fahrmeir, Gerhard Tutz, 2013-11-11 Classical statistical models for regression time series and longitudinal data provide well established tools for approximately normally distributed variables Enhanced by the availability of software packages these models dominated the field of applications for a long time With the introduction of generalized linear models GLM a much more flexible instrument for statistical modelling has been created The broad class of GLM s includes some of the classical linear models as special cases but is particularly suited for categorical discrete or nonnegative responses The last decade has seen various extensions of GLM s multivariate and multicategorical models have been considered longitudinal data analysis has been developed in this setting random effects and nonparametric predictors have been included These extended methods have grown around generalized linear models but often are no longer GLM s in the original sense The aim of this book is to bring together and review a large part of these recent advances in statistical modelling Although the continuous case is sketched sometimes throughout the book the focus is on categorical data The book deals with regression analysis in a wider sense including not only cross sectional analysis but also time series and longitudinal data situations We do not consider problems of symmetrical nature like the investigation of the association structure in a given set of variables For example log linear models for contingency tables which can be treated as special cases of GLM s are totally omitted The estimation approach that is primarily considered in this book is likelihood based
