Abstract

Concept generation is at the heart of engineering design. This chapter considers an emerging tool set for generating concepts: function-based synthesis methods. To understand this tool set, the prominent methods in the field are reviewed and summarized, with a subset being investigated with more technical rigor. In addition to this review and investigation, the methods are analyzed against three models: a method architecture, design process, and research model. This analysis extracts the fundamental features of the methods, provides a basis for comparison, and elicits future research opportunities, directions, and industrial applications. Through this analysis, a clear picture emerges of the function-based synthesis field: Many fundamental research results have been realized, and it is just a matter of time before we have tools to assist product development teams in generating dynamic systems, kinematic structures, and the skeletal backbones of consumer products.
