Field Analysis:

Electric Field Analysis Sivaji Chakravorti, 2017-12-19 *Electric Field Analysis* is both a student friendly textbook and a valuable tool for engineers and physicists engaged in the design work of high voltage insulation systems. The text begins by introducing the physical and mathematical fundamentals of electric fields presenting problems from power and dielectric engineering to show how the theories are put into practice. The book then describes various techniques for electric field analysis and their significance in the validation of numerically computed results as well as. Discusses finite difference finite element charge simulation and surface charge simulation methods for the numerical computation of electric fields. Provides case studies for electric field distribution in a cable termination around a post insulator in a condenser bushing and around a gas insulated substation GIS spacer. Explores numerical field calculation for electric field optimization demonstrating contour correction and examining the application of artificial neural networks. Explains how high voltage field optimization studies are carried out to meet the desired engineering needs. *Electric Field Analysis* is accompanied by an easy to use yet comprehensive software for electric field computation. The software along with a wealth of supporting content is available for download with qualifying course adoption.

Optical Electromagnetic Field Analysis Using Python Kotaro Kajikawa, Takayuki Okamoto, 2025-07-31 In this book Kajikawa and Okamoto explain how to use Python to calculate and visualize the optical response of microscopic structures and systems. Throughout the authors provide varied examples to instruct readers in the application of theoretical knowledge to real world scenarios. Electromagnetic field analysis is often necessary to determine the optical response of materials with microscopic structures. Although the principles are widely described the manual calculation and visualization of results are not and remain challenging. Python is the ideal language to use for this as it has a large functional library for visualizing analysis results and is suitable for programming beginners to use at low cost so it has many advantages over languages like Fortran, BASIC and C. Here the authors introduce the application of Python to various electromagnetic field analysis scenarios in the field of nanophotonics. The first half of the book describes cases in which there is an analytical solution for the structure and addresses scenarios such as scattering and absorption in spherical and cylindrical structures and complex structures such as rotating ellipsoids, sphere aggregated structures and hemispherical structures. The second half describes methods including rigorous coupling wave analysis, finite difference time domain method and discrete dipole approximation for numerically solving varied structures. This book enables readers to conduct their own electromagnetic field analysis quickly, cheaply and accurately without in depth study of other complicated and time consuming approaches or programs. This book is invaluable for researchers and postgraduate students working in the fields of optics and photonics. Additionally the contents are useful

not only for those conducting electromagnetic field analysis but also those simulating physical chemical and biological phenomena
