The animal based model remains the predominant research platform in biomedical and pharmaceutical research Animal usage in the UK alone increased by 6% in 2021 with mice and rats accounting for just under 1 million experimental procedures However the mismatch between animal models and clinical reality e g species barrier age mismatch populational diversity level presents a major hurdle for clinical translation Consequently only 10% of new drug candidates are eventually certified for clinical use presenting a soaring research cost of 4 12 billion new drug in recent years This grand challenge stimulates the development of human tissue engineered human models e g organoids microfluidic chips and organ on a chip systems as potential solutions to replace animal models Despite the rapid progress in this field current tissue engineered human models are still insufficient to recapitulate the complex morphology of target tissues and consequently inadequate to model realistic tissue function or generate transplantable tissue organ
