Moody, 2014-09-02 Providing expert coverage of all major events in early embryogenesis and the organogenesis of specific systems and supplemented with representative clinical syndromes Principles of Developmental Genetics Second Edition discusses the processes of normal development in embryonic and prenatal animals including humans The new edition of this classic work supports clinical researchers developing future therapies with its all new coverage of systems biology stem cell biology new technologies and clinical disorders A crystal clear layout exceptional full color design and bulleted summaries of major takeaways and clinical pathways assist comprehension and readability of the highly complex content All new coverage of systems biology and stem cell biology in context of evolving technologies places the work squarely on the modern sciences Chapters are complemented with a bulleted summary for easy digestion of the major points with a clinical summary for therapeutic application Clinical highlights provides a bridge between basic developmental biology and clinical sciences in embryonic and prenatal syndromes

Master Control Genes in Development and Evolution Walter J. Gehring, 1998-01-01 In this fascinating book one of the world's most eminent developmental biologists discusses some of the exciting new insights into how genes control development Walter Gehring describes in vivid detail his essential contributions to the landmark discovery of the homeobox a characteristic DNA segment found in the genes of all higher organisms from the fruitfly to humans and he explains how this has provided the key to our modern understanding of development and evolution The book thus becomes not only a lucid discussion of genetics but also an engaging description of the art of scientific investigation Gehring begins his story by looking at the work of the many researchers who laid the foundation for the fields of molecular cellular and developmental biology providing insightful vignettes of past and present investigators He then describes his laboratory's hunt for the gene that caused odd mutations in the fruitfly in which for example antennae on the head were transformed into legs He explains that researchers eventually found that the same master control genes that dictate the body plan in flies also pattern human bodies limbs hands heart and brain And he illustrates the universality of the genetic control of development by describing the development of the eye eyes as different as those of humans squids and flies he shows develop under the same master control gene

Coming To Life Volhard Christiane Nusslein,2006-04-11 Christiane Nusslein Volhard winner of The Nobel Prize in Medicine gives a concise and illustrative overview of genetics evolution and cellular processes as well as a discussing of current ethical issues in human biology Coming to Life is a remarkable journey through developmental biology that reveals miraculous processes in the microscopic world of cells Through an accounting of groundbreaking discoveries Christiane Nusslein Volhard tells us many answers to historical and contemporary questions in science For example she brings us the newest knowledge about embryonic forms explains the genetic mechanisms that influence adult development of all animals and shares insights into the ethical standards society most uphold in the face of new scientific discoveries As the author leads us from laboratory research to its applications in human beings we also come to understand why children look like their parents how an embryonic cell knows to become an eye rather than an eyelash and other incredible influences that result in variety in life Complete with her own hand drawn illustrations Coming to Life gives a rare opportunity to understand a Nobel Prize winner's passion for science in concise understandable language 55 b w illustrations

Genes in Development Eva M. Neumann-Held, Christoph Rehmann-Sutter,2006 In light of scientific advances such as genomics predictive diagnostics genetically engineered agriculture nuclear transfer cloning and the manipulation of stem cells the idea that genes carry predetermined molecular programs or blueprints is pervasive Yet new scientific discoveries such as rna transcripts of single genes that can lead to the production of different compounds from the same pieces of dna challenge the concept of the gene alone as the dominant factor in biological development Increasingly aware of the tension between certain empirical results and interpretations of those results based on the orthodox view of genetic determinism a growing number of scientists urge a rethinking of what a gene is and how it works In this collection a group of internationally renowned scientists present some prominent alternative approaches to understanding the role of dna in the construction and function of biological organisms Contributors discuss alternatives to the programmatic view of dna including the developmental systems approach methodical culturalism the molecular process concept of the gene the hermeneutic theory of description and process structuralist biology None of the approaches cast doubt on the notion that dna is tremendously important to biological life on earth rather contributors examine different ideas of how dna should be represented evaluated and explained Just as ideas about genetic codes have reached far beyond the realm of science the reconceptualizations of genetic theory in this volume have broad implications for ethics philosophy and the social sciences Contributors Thomas B rglin Brian C Goodwin James Griesemer Paul Griffiths Jesper Hoffmeyer Evelyn Fox Keller Gerd B M ller Eva M Neumann Held Stuart A Newman Susan Oyama Christoph Rehmann Sutter Sahotra Sarkar Jackie Leach Scully
