Explosions Course Prevention Protection:

Dust Explosions Wolfgang Bartknecht, 1989 The author summarizes today's knowledge of the cause and consequences of dust explosions which were the main focus of his professional life. The presence of explosible dust-air mixtures does not generally represent a risk of an explosion although all organic and metallic dusts are explosible. The author develops test methods for explosion hazards associated with dust and constructive methods to prevent dust explosions. The book is written for practical use. The reader learns to recognise the hazard of a dust explosion and the effectiveness of safety measures. The book is richly illustrated and demonstrates the correct use of the empirical theories. Explosions, Course, Prevention, Protection Wolfgang Bartknecht, 1981 The hazards of explosions to human beings and to material values can hardly be overrated. These hazards are aggravated since powders and gas mixtures with a tendency to explode in general do not signal their inherent danger. But there is one powder whose name already indicates the hazard it represents. This substance is gunpowder. Whoever handles it is conscious of the danger to which he is exposed. He also knows that it is he himself who can trigger the explosion; he also can keep the hazard under control. In this respect gunpowder has become one of the more harmless substances. Names and information indicating danger will create hazard consciousness in man which is a necessary condition for the institution of measures to protect himself and his material values. Gunpowder is only one of innumerable powders or dusts with an inherent dust explosion hazard. Technical development leads to an ever growing number of solids in the form of dust. Important properties of solids can only be put to use if they are present in the form of dusts. Only in the form of dust can flour be used for food, concrete for structures. No medicinal tablets could be made without pharmaceutical products in powder form. These are only a few examples of powders being of vital importance to men. Their number could be increased at will. Nichols, 2016-07-25 Fire and Explosion Protection for the Combustible Dust Processing Industries A spark by itself is not dangerous For a fire or explosion to occur there must be three essential ingredients a combustible material oxygen and an ignition source If one of these three is eliminated then so is the potential for fire or explosion In today's production plants we often have to cope with all of the components that lead to a fire or cause an explosion Dust fume extraction systems and pneumatic conveyors increase the danger of fire Once sparks or glowing embers are created the pneumatic extraction system conveys these hazards to other areas At this point two of the three ingredients for the creation of fires and or explosions are transported When this conveyed danger meets a supply of combustible materials filter cloth deposited dust or the material in the separator or silo it becomes more likely that the feared reaction will occur Increased environmental protection measures regarding dust emissions and tightened regulations for air pollution have led to the increased use of filter systems and has increased the danger of dust explosions and fires due to the concentration of the combustible material at the filter Because of the high cost of heating and cooling plant buildings many air systems return the clean air directly back into the production facility This practice although energy efficient presents an additional hazard if the collector catches fire This fire will be propagated via the return air duct

into the plant structure with devastating consequences
